

SIMATS ENGINEERING

Saveetha Institute of Medical and Technical Sciences
Chennai- 602105

Student Name: T.Narasimha Raju

Reg. No.:192425233

Course Code: MLA0408

Slot: C

Course Name: Deep Learning

Course Faculty: Dr.D.Sudhagar

Module 2: Facial Emotion Recognition

Module Photographs:

Project Description:

Facial Emotion Recognition is the process of identifying human emotions from facial expressions in an image or video. It uses computer vision and machine learning techniques to analyze facial features and expressions. Common emotions detected include happiness, sadness, anger, fear, surprise, and disgust. The system first detects the face and then extracts important facial features such as the eyes, eyebrows, nose, and mouth. These features are analyzed to determine the emotional state of the person. Deep learning models, especially Convolutional Neural Networks (CNNs), are commonly used for accurate emotion classification. Facial Emotion Recognition can work with both static images and real-time video. It is widely used in applications such as human-computer interaction, security, healthcare, education, and customer analysis. The accuracy of the system depends on image quality, lighting, facial pose, and the training data used. Modern systems can recognize emotions quickly and automatically. Facial Emotion Recognition helps computers understand human behavior and respond more naturally to users.
